

AI Conduct Declaration – Use of Generative AI Assistance

During the course of this project, I used a large language model (ChatGPT) **only for conceptual clarification and understanding of MLOps principles**. The AI was **not used to generate final code, results, or conclusions**, but rather as a learning aid similar to online documentation or textbooks.

- What is the difference between MLOps and traditional DevOps in the context of machine learning systems?
- what do tools like MLflow and DVC help with and why are they needed?
- What types of metadata are typically tracked during machine learning experiments?
- What is datadrift? Why does it happen?
- How is concept drift different from data drift?
- What role does monitoring play in maintaining reliable ML systems?
- How are training, validation, and inference logs used in MLOps workflows?
- What are the common command used for flask endpoint (building an API wrapper thats why) could you give a boilerplate code for it?
- Why do we use YAML files ?
